Edible Insects - Statistics & Facts | Statista

Background: Entomophagy is a common practice in many parts of the world. Allergic symptoms after insect consumption have been reported in healthcare literature and in the news. Objectives: We evaluated prevalence and association of allergic history and self-reported allergic reactions after ento-mophagy.

Prevalence and cluster effect of self-reported allergic ...

Surveys for entomophagy in the Western world are limited (Gahukar, 2011), but it is very telling all such studies have focused on "readiness" or "willingness" to adopt insects, not on whether or not users actually use them.

Why we still don't eat insects: Assessing entomophagy ...

Background Insect consumption (entomophagy) is a potentially high nutritious and healthy source of food with high fat, protein, vitamin, fiber and micronutrient content. At least 2 billion people globally eat insects (over 1900 edible species) though this habit is regarded negatively by others. There is a limited amount of data on the perception and consumption of insects.
