## **Advanced Physics of Electron Transport in Semiconductors ...**

The core of the text is electronic transport, with ample discussions of the transport equations derived both in the quantum picture (the Liouville-von Neumann equation) and semi-classically (the Boltzmann transport equation, BTE). An advanced chapter, Chapter 18, is strictly related to the 'tricky' transition

from the time-reversible Liouville-von Neumann equation to the time-irreversible Green's functions, to the density-matrix formalism and, classically, to the Boltzmann transport ...

This effect is called electron transport. This is one of the most common techniques to characterize materials. Many of the phenomena can be observed through this technique, such as electrical conductivity, electron mobility. As the dimension of materials reduces to be comparable to de Broglie wavelength or inelastic scattering length (2D materials, nanowires, and quantum dots), quantum phenomena emerge at cryogenic temperatures, e.g., weak localization in 2D materials and single electron of ...
