Analysis Of Parallel Merge Sort

analysis. The sequential merge sort requires $O(N \log N)$ [3] time to sort N elements, which is the best that can be achieved (modulo constant factors) unless data are known to have special properties such as a known distribution or degeneracy. This paper describes implementation of the merge sort within a parallel processing environment. In the

Analysis of Parallel Merge Sort Algorithm

The aim of this paper is to evaluate the performance of parallel merge sort algorithm on loosely coupled architecture and compare it with theoretical analysis [1].The parallel computational time complexity is $O(p)$ [3] using p processes and one element in each process. It has been found that there is

Let's consider parallel versions. Now suppose we wish to redesign merge sort to run on a parallel computing platform. Just as it useful for us to abstract away the details of a particular programming language and use pseudocode to describe an algorithm, it is going to simplify our design of a parallel merge sort algorithm to first consider its implementation on an abstract PRAM machine.

classic sorting methods: quick sort, trigeminal heap sort and merge sort with parallel methods: fast sort [16] and modified merge sort [17]. 2.1. Parallel Random Access Machine For the analysis of parallel sorting algorithm it is con-venient to use the parallel machine model the PRAM (parallel random access machine) as shown in Figure 1.

The Analysis of Energy Performance in Use Parallel Merge ...

Parallel Merge Sort Merge sort first divides the unsorted list into smallest possible sub-lists, compares it with the adjacent list, and merges it in a sorted order. It implements parallelism very nicely by following the divide and conquer algorithm.

Parallel Algorithm - Sorting - Tutorialspoint

Merge sort parallelizes well due to the use of the divide-and-conquer method. Several different parallel variants of the algorithm have been developed over the years. Some parallel merge sort algorithms are strongly related to the sequential top-down merge algorithm while others have a different general structure and use the K-way merge method.

Merge sort - Wikipedia

Definition: An $m \times n$ -array of data is called roughly sorted, if sorting of the rows suffices to sort the array completely. In a roughly sorted array each data element is already in its proper row. The idea of 4-way mergesort is to merge four roughly sorted $k/2 \times k/2$ -arrays to one roughly sorted $k \times k$ -array.

Analysis of Merge Sort. Let's have a look at the MERGE function first. It just iterates over the arrays and the arrays can have at most size of n . In the rest of the part, we are just comparing and assigning values and they are constant time processes.

Performance analysis is based on benchmark tests for the algorithms implemented in C# in Visual Studio 2015 Enterprise on MS Windows Server 2012, namely: quick sort, heap sort, and classic merge, and presented here is flexible parallel merge.

Fully Flexible Parallel Merge Sort for Multicore Architectures

Using OpenMP, implement a parallelized Merge Sort algorithm to sort a given set of elements and determine the time required to sort the elements. Repeat the experiment for different values of n , the number of elements in the list to be sorted and plot a graph of the time taken versus n .

Mergesort Parallel Program ~ Learn And Teach Code

This article shows the energy consumption analysis by parallel sorting algorithms. Sort algorithms are used in information systems and databases, to select and organize the information. The subject of this article is research into energy consumption and computational complexity for parallel sorting methods by merging compared to classic methods.

Mergesort requires time to sort N elements, which is the best that can be achieved (modulo constant factors) unless data are known to have special properties such as a known distribution or degeneracy. We first describe two algorithms required in the implementation of parallel mergesort: compare-exchange and parallel merge. Compare-Exchange.

On a two cores machine I got that parallel merge sort is more than 2x faster than sequential quicksort and up to 25% faster than parallel quicksort but at the cost of additional $O(n)$ space. Still it is a good example of how to use dynamic task parallelism.
