The skeletal system includes all of the bones, cartilages, and ligaments of the body that support and give shape to the body and body structures. The skeleton consists of the bones of the body. For adults, there are 206 bones in the skeleton. Younger individuals have higher numbers of bones because some bones fuse together during childhood and adolescence to form an adult bone.

Divisions of the Skeletal System | Anatomy and Physiology I

The skeletal system is the body system composed of bones, cartilages, ligaments and other tissues that perform essential functions for the human body. Bone tissue, or osseous tissue, is a hard, dense connective tissue that forms most of the adult skeleton, the internal support structure of the body. In the areas of the skeleton where whole bones move against each other (for example, joints like the shoulder or between the bones of the spine), cartilages, a semi-rigid form of connective ...

Skeletal System • Anatomy & Function - GetBodySmart

The science of physiology often studies the functions of different body parts or organ systems of a living creature. In this light, the physiology of the skeletal system can be enumerated in five words: shape, support, protection, storage, and movement. These functions apply both to the human body and almost all animals categorized as vertebrates.

What Is the Physiology of the Skeletal System? (with pictures)

List the 5 functions of the skeletal system. 1. support. 2. protect. 3. movement. 4. store minerals and fats. 5. blood cell formation. Explain the support function. Bones form the internal framework that supports the body and cradles its soft organs.
