Begin with cells, the building blocks of life. Build your own cell by sculpting the different parts. Move into tissues, organs and systems to discover all the different systems that make the human body function. Next is the skeletal system. Invent your own alien skeleton using the different bones found in the human body. Understand that these bones are held together with joints and cartilage. Finally, end this part of the journey with the muscular system.

Skeletal muscle cells. Muscle cells, commonly known as myocytes, are the cells that make up muscle tissue. There are 3 types of muscle cells in the human body; cardiac, skeletal, and smooth. Skeletal muscle cells are long, cylindrical, multi-nucleated and striated. Each nucleus regulates the metabolic

The musculoskeletal system (locomotor system) is a human body system that provides our body with movement, stability, shape, and support. It is subdivided into two broad systems: Muscular system, which includes all types of muscles in the body. Skeletal muscles, in particular, are the ones that act on the body joints to produce movements.

We used single-cell RNA sequencing to profile human skeletal muscle tissues from embryonic, fetal, and postnatal stages. In silico, we identified myogenic as well as other cell types and constructed a “roadmap” of human skeletal muscle ontogeny across development. In a similar fashion, we also profiled the heterogeneous cell cultures generated from multiple human pluripotent stem cell (hPSC) myogenic differentiation protocols and mapped hPSC-derived myogenic progenitors to an embryonic ...
