Diseases due to Errors in Protein Metabolism

In female animals, reproduction and metabolism are tightly connected and reciprocally regulated [6,7]. During the reproductive period of life, the physiological activity of the gonads, with

Metabolic disease, any of the diseases or disorders that disrupt normal metabolism, the process of converting food to energy on a cellular level.

Metabolic diseases affect the ability of the cell to perform critical biochemical reactions that involve the processing or transport of proteins, carbohydrates, or lipids.

Some conditions affecting female reproduction are caused by endocrine disorders. For example, many women with PCOS have insulin resistance, in which the body cannot use insulin efficiently. This leads to high circulating blood levels of insulin, called hyperinsulinemia.

Metabolism, which is defined as the group of chemical reactions that sustain life, is now acknowledged to influence every aspect of physiology, and these influences begin at the earliest stages of life. We aim to discover how the

metabolic activity of gametes and early embryos is modified in response to health, disease, lifestyle and the wider environment, and how these changes at the embryonic level can predispose to a range of non-communicable disease in the offspring.
