This is the first text and monograph about DNA computing, a molecular approach that might revolutionize our thinking and ideas about computing.

Although it is too soon to predict whether computer hardware is likely to change from silicon to carbon and from microchips to DNA molecules, the theoretical premises have already been studied extensively.

Deoxyribonucleic acid (DNA) DNA computing is an emerging branch of computing which uses DNA, biochemistry, and molecular biology hardware, instead of the traditional silicon-based computer technologies. Research and development in this area concerns theory, experiments, and applications of DNA computing.

(a.k.a. biomolecular
computing,
biocomputing,
biochemical

computing, DNA
computing) is a
computational
paradigm in which data
is encoded as
biomolecules such as
DNA strands, and
molecular biology tools
act on the data to
perform various
operations (e.g.,
arithmetic or logical
operations).
