Although some of it is dated and superseded by decades of new research, it is amazing how insightful Bowen was in the 1920's. It is interesting and important for modern petrologists (and certainly students) to read this book to better understand some of the principles behind our current thinking and to see how far we have come (or not in some cases) in understanding the evolution of igneous rocks.

Within the field of geology, Bowen's reaction series is the work of the petrologist Norman L. Bowen, who summarized, based on experiments and observations of natural rocks, the crystallization sequence of typical basaltic magma undergoing fractional crystallization (i.e. crystallization wherein early-formed crystals are removed from the magma by crystal settling, leaving behind a liquid of slightly different composition).

Bowen's reaction series - Wikipedia

From G. F. Becker's and L. V. Pirsson's early enunciations linking the dynamics of magma chambers to the rock records of sills and plutons to this day, two features stand at the centre of nearly every magmatic process: solidification fronts and phenocrysts.
