One possible solution is to say that at least one of  $f_x, f_y$  is different than zero (these are partial derivatives) and so the set of singular points is the affine variety of  $A^2$  given by  $V(f, f_x, f_y)$ . Since  $f$  is irreducible and assuming that  $f_x \neq 0$ , the sequence  $f, f_x$  is  $k[x, y]$ -regular and so  $\dim_k k[x, y]/(f, f_x, f_y) = 0$ .

(6)Algebraic curves were first studied over the complex numbers. Some people studied complex analysis of Riemann Surfaces, and others studied polynomials in two variables. Remark 2.1. We will use the language of smooth projective curves and compact Riemann surfaces interchangeably. We will assume all curves are over the complex numbers.
