Insect Species Conservation

While biodiversity loss is a global problem, conserving habitat for species of insects is uncommon and generally of low priority, although there are exceptions. More commonly insect conservation occurs indirectly, either through the setting aside of large portions of land using "wilderness preservation" as the motive, or through protection of "charismatic vertebrates".

Lack of human appreciation of importance, coupled with the general disregard and dislike of insects, is an enormous perception impediment to their conservation. This impediment coupled with the taxonomic impediment (at most only about 7-10% of insects are scientifically described) must be overcome for realistic biodiversity conservation.

Other key aspects of biodiversity and conservation include the roles of insects as pollinators, and an example involving Agave is included (Lindsay et al. 2011). There is also the issue of introduced and invasive pests and their control, and a case involving an ant species in Australia is presented (Hoffmann 2011). The location and introduction of

Conserving insects, the foundation of the world's biodiversity, is the first step towards protecting the planet. Insect Ecology and Conservation is the study of the most abundant creatures on Earth—insects—and their interactions with other wildlife, humans, and the environment. Our students wonder how and why insects do what they do.

However, our knowledge of these charismatic insects is still in many ways fragmentary and in need of serious amplification. We know surprisingly little about the biodiversity and life histories of butterflies, sometimes even of the more common species, which compromises our ability to develop and implement effective conservation programs for them.

Dr. Bethany Bradley is a Professor of Biogeography and Invasion Ecology in the Department of Environmental Conservation. She is interested in how the geographical locations of species across landscapes and regions can inform ecological understanding of species distributions, invasion risk assessments, and conservation planning.
