The Flow in Lid-Driven Cavity - Stanford University

The lid-driven cavity problem has long been used a test or validation case for new codes or new solution methods. The problem geometry is simple and two-dimensional, and the boundary conditions are also simple. The standard case is fluid contained in a square domain with Dirichlet boundary conditions on all sides, with three stationary sides and one moving side (with velocity tangent to the side).

Lid-driven cavity problem - CFD-Wiki, the free CFD reference

The lid-driven cavity is a well-known benchmark problem for viscous incompressible fluid flow . The geometry at stake is shown in Figure 27. We are dealing with a square cavity consisting of three rigid walls with no-slip conditions and a lid moving with a tangential unit velocity. The lower left corner has a reference static pressure of 0.

Lid-driven cavity

Numerical solution of the 2D incompressible steady Navier-stokes equations is obtained for lid-driven square cavity case for Reynolds Numbers $100 < Re < 5000$, using Finite Volume Method with primitive variable formulation on a uniform grid. Convective terms are discretized using second order central differencing scheme, and SIMPLE algorithm is used to decouple velocity and pressure.

Tutorial 2 Lid Driven Cavity IITP

2.1 Lid-driven cavity flow. This tutorial will describe how to pre-process, run and post-process a case involving isothermal, incompressible flow in a two-dimensional square domain. The geometry is shown in Figure 2.1 in which all the boundaries of the square are walls.

OpenFOAM v6 User Guide: 2.1 Lid-driven cavity flow

One way to verify the AIM solution is to compare it with results from Fluent. Below is the velocity contour of a lid driven cavity done in Fluent in a study called "Three Dimensional Lid Driven Cavity" by Ashok Sivanandham, Boris Makarov and Laith Zori. By comparing it to the velocity contour created by AIM, we can see that they are similar.

This paper is concerned with numerical study of the two-sided lid-driven fluid flow, in a staggered cavity. The ANSYS FLUENT commercial software was used for the simulation. In one of the simulated cases the lids are moving in opposite directions.

USING THE ANSYS FLUENT FOR SIMULATION OF TWO-SIDED LID ...

More about the Lid Driven Cavity The LDC problem is one that is simple in its definition, yet requires a rather sophisticated computational algorithm to seek a solution. These are numerical experiments where exact answers in terms of mathematical expressions are either unavailable or so complicated as to be impractical.

Lid Driven Cavity - Vermont Veterinary Cardiology

The lid-driven cavity consists of a square cavity filled with fluid. At the top boundary, a tangential velocity is applied to drive the fluid flow in the cavity. The remaining three walls are defined as no-slip conditions; that is, the velocity is 0.

This classic two dimensional driven cavity test case is documented in literature by Ghia [1]. The fluid motion in the cavity is driven by shear forces due to a moving wall boundary condition at the top of the cavity. Figure 1 details the geometry of the cavity along with the dashed lines Dh and Dv showing where data is taken for comparison ...
