The subject of vibration deals with the oscillatory motion of dynamic systems. A dynamic system is a combination of matter which possesses mass and whose parts are capable of relative motion. All bodies possess mass and elasticity are capable of vibration. The mass is inherent of the body, and the elasticity is due to the relative motion of the parts of

An Introduction to Vibration Analysis Theory and Practice

Book Description: This volume covers the proceedings of the ICASE/LaRC workshop on "Finite Element Theory and Application" held during July 28-30, 1986. The purpose of this workshop was to provide an update on the status of finite element theory, to assess the impact of this theory on practice, and to suggest directions for future research.

lost (damper). The vibration of a system involves the alternating transfer of energy between its potential and kinetic forms. In a damped system, some energy is dissipated at each cycle of vibration and must be replaced from an external source if a steady vibration is to be maintained. Although a single physical structure may store
