When a skeletal muscle contracts, thin filaments slide past the thick filaments. In this process, the H bands and I bands get smaller; the zones of overlap get larger, the Z lines move closer together, and the width of the A band remains constant. This explanation is known as the sliding filament theory (Martini and Ober, 2011). Source

The Sliding Filament Theory

The Sliding Filament Theory and How Muscles Contract Fast Facts: All muscles are made up of two contractile proteins called actin and myosin. Groups of actin and myosin form myofibrils, which group together to form a muscle fiber, which group together to form a fascicle, which group together to form the whole muscle.
