After World War I, improvements in chemical technology led to an explosion in new forms of plastics, with mass production beginning in the 1940s and 1950s (around World War II). Among the earliest examples in the wave of new polymers were polystyrene (PS), first produced by BASF in the 1930s, [2] and polyvinyl chloride (PVC), first created in 1872 but commercially produced in the late 1920s. Plastic - Wikipedia
plastic Synthetic material composed of organic molecules, often in long chains called polymers, that can be shaped and then hardened. The weight and structure of the molecules determine the physical and chemical properties of a given compound. Plastics are synthesized from common materials, mostly from petroleum.

Plastics | Encyclopedia.com
Plastic, polymeric material that has the capability of being molded or shaped. This property of plasticity, often found in combination with other special properties such as low density, low electrical conductivity, transparency, and toughness, allows plastics to be made into a great variety of products.

plastic | Composition, Uses, Types, & Facts | Britannica
Plastics are polymers —assemblies of identical chemical subunits, called monomers, that are linked together in the form of a chain. The properties of a plastic, like those of all polymers, are defined by the monomers in the chain and by the number of links and cross-links in its structure.
