A silicon carbide MOSFET was first created by Wolfspeed about 20 years ago. Compared to silicon MOSFETs, these MOSFETs provide higher temperature operation, an increased critical breakdown strength (10x that of silicon), higher switching frequencies, and reduced switching losses.

The vertical double-diffused (VD) MOSFETs were also optimized for RF applications by replacing the traditional polysilicon gate with metal gate structures. Although the vertical architecture enables the design of high voltage devices with significant output power, their operating frequency was limited to below 500 MHz.
