Stoichiometry is the quantitative relationship between reactants and products in a chemical reaction. Using stoichiometry, you can predict the amount of product that can be produced from a given amount of reactants, and vice versa. In this activity, you will explore the principles of stoichiometry by building S'mores, the

Stoichiometry Lab In class, you've learned to compute how much of a chemical product you can make when you mix measured amounts of chemical reactants. In this lab, you will be actually using this information to predict how much product will be made; you will then calculate the percent yield gained from the amount that you actually recover.

On the second day they conduct the lab, and on the third day they write and critique their lab report. In this lesson students will conduct a lab that they planned in the previous lesson. In their experimental design, students used stoichiometry to predict how much carbon dioxide would be produced from a set amount of vinegar and baking soda.
