for both values of Ω . Although the continuous-time and the discrete-time signals have infinite energy, they have finite power. That the continuous-time signal $x(t)$ has finite power can be shown as indicated in Chapter 1. For the discrete-time signal, $x[n]$, we have for the two frequencies:

The discrete logarithm problem is considered to be computationally intractable. That is, no efficient classical algorithm is known for computing discrete logarithms in general. A general algorithm for computing $\log_b a$ in finite groups G is to raise b to larger and larger powers k until the desired a is found.

The discrete logarithm problem is to find the exponent in the expression $\text{Base}^{\text{Exponent}} = \text{Power} \pmod{\text{Modulus}}$. This applet works for both prime and composite moduli. The only restriction is that the base and the modulus, and the power and the modulus must be relatively prime.

The power of a discrete-time signal $x[n]$ is given by $P_x = \lim_{N \rightarrow \infty} \frac{1}{2N+1} \sum_{n=-N}^N |x[n]|^2$. which is identical to the first formula in your question. The second formula is wrong and does not even make any sense due to the infinite limits of the sum.

Discrete time views values of variables as occurring at distinct, separate "points in time", or equivalently as being unchanged throughout each non-zero region of time ("time period")—that is, time is viewed as a discrete variable. Thus a non-time variable jumps from one value to another as time moves from one time period to the next. This view of time corresponds to a digital clock that ...

2.4 c J.Fessler, May 27, 2004, 13:10 (student version) 2.1.2 Classification of discrete-time signals The energy of a discrete-time signal is denoted as $E_x = \sum_{n=-\infty}^{\infty} |x[n]|^2$: The average power of a signal is denoted as $P_x = \lim_{N \rightarrow \infty} \frac{1}{2N+1} \sum_{n=-N}^N |x[n]|^2$: If E is finite ($E < \infty$) then $x[n]$ is called an energy signal and $P = 0$. If E is infinite, then P can be either finite or infinite.

One of the most noticeable tradeoffs between discrete power solutions and pre-designed modules is the space they consume and the associated power density they deliver. Power density is a measure of the number of watts of power converted per volume of space consumed; typically specified as Watts per cubic inch (W/in³).
