THE SHAPIRO-WILK AND RELATED TESTS FOR NORMALITY 3 and the sample kurtosis is $K' = -3 + \frac{1}{n} \sum_{j=1}^n (X_j - \bar{X})^4 / (s^2 X^2)^2$. These are defined for any finite sample with $s^2 X > 0$, in other words, not all X_j are equal. If X_1, \dots, X_n are actually i.i.d. with some normal distribution and n is fairly large, then S and K' should be close to 0.

The Shapiro-Wilk test is a test of normality in frequentist statistics. It was published in 1965 by Samuel Sanford Shapiro and Martin Wilk.

The Shapiro-Wilk test answers precisely that. How Does the Shapiro-Wilk Test Work? A technically correct explanation is given on this Wikipedia page. However, a simpler -but not technically correct- explanation is this: the Shapiro-Wilk test first quantifies the similarity between the observed and normal distributions as a single number: it superimposes a normal curve over the observed distribution as shown below.

SPSS Shapiro-Wilk Test - Quick Tutorial with Example

The Shapiro-Wilk test is a statistical test for the hypothesis that a group of values come from a normal distribution. (The mean and variance of this normal distribution need not be 0 or 1 respectively.) Empirically, this test appears to have the best power (among tests that test for normality).

The Shapiro-Wilk Test In addition to a visual inspection of histograms and calculation of skewness and kurtosis values, SPSS provides a formal statistical test of normality referred to as the Shapiro-Wilk test. A perfect normal distribution will have a Shapiro-Wilk value of 1.00.

It was introduced by Shapiro and Wilk in 1965. The test compares the ordered sample values with the corresponding order statistics from the specified distribution. The test is most commonly used to test for a normal distribution, in which case the test statistic, W , is given by where x_i

Shapiro-Wilk test - Oxford Reference

The basic approach used in the Shapiro-Wilk (SW) test for normality is as follows: Rearrange the data in ascending order so that $x_1 \leq \dots \leq x_n$. Calculate SS as follows: If n is even, let $m = n/2$, while if n is odd let $m = (n-1)/2$; Calculate b as follows, taking the a_i weights from the Table 1 (based on the value of n) in the Shapiro-Wilk Tables.
