Theory Of Evolution Reinforcement And

Reinforcement is a process of speciation where natural selection increases the reproductive isolation between two populations of species. This occurs as a result of selection acting against the production of hybrid individuals of low fitness. The idea was originally developed by Alfred Russel Wallace and is sometimes referred to as the Wallace effect. The modern concept of reinforcement originates from Theodosius Dobzhansky. He envisioned a species separated allopatrically, where during secondar

Second, the theory of evolution provides an example of historical explanation, the type of explanation that applies to operant behavior. A history of reinforcement and punishment parallels a history of natural selection, except that the first operates on a population of actions within the lifetime of an individual, whereas the second operates on a population of organisms over many generations.

Reinforcement is known as secondary reinforcement if the reproductive isolation has partly evolved allopatrically, and is then reinforced when the two populations come into secondary contact. Reinforcement could occur whenever two forms coexist, and the hybrids between them have lower fitness than crosses within each form.

reducing the production of hybrids. Evidence for speciation by reinforcement has been gathered since the 1990s, and along with data from comparative studies and laboratory experiments, has overcome many of the objections to the theory. Differences in behavior or biology that inhibit formation of hybrid zygotes are termed prezygotic isolation. Reinforcement

Evidence for speciation by reinforcement - Wikipedia

The evolutionary approach is effective in investigating the collective behavior of the population in the long term. However, human learning involves more initiative than biological evolution, and therefore, we have integrated reinforcement learning with replicator dynamics to investigate negotiation behavior.

Schedules of reinforcement affect the rate of response, the acquisition of a behaviour, and resistance to extinction. If continuous reinforcement is used, as opposed to intermittent reinforcement, acquisition (learning) of the behaviour will occur faster.

Reinforcement Theory of Motivation The reinforcement theory holds that as an employer you can influence and change the behavior of employees by reinforcement, punishment or extinction. To encourage the behavior you would like to see in your organization rewards are awarded and for prevention of undesirable behaviors punishment is meted out.

Reinforcement theory is the process of shaping behavior by controlling the consequences of the behavior. In reinforcement theory a combination of rewards and/or punishments is used to reinforce desired behavior or extinguish unwanted behavior.

Reinforcement, or the strengthening of reproductive isolation in response to hybridization costs, is a case in which natural selection directly contributes to the origin of new species. From its conception, reinforcement has enjoyed alternate periods of enthusiasm and rejection, in which powerful verbal arguments identified obstacles that were subsequently solved by novel theory.
