Thermochemistry Practice Problems (Ch. 6)

1. Consider 2 metals, A and B, each having a mass of 100 g and an initial temperature of 20 °C. The specific heat of A is larger than that of B. Under the same heating conditions, which metal would take longer to reach 21 °C? Explain your reasoning.

Thermo PRACTICE PROBLEMS

The first problem requires the use of the molar heat of vaporization and the second requires the use of the molar heat of fusion. Here are the two solutions: $40.7 \text{ kJ/mol} \times (100.0 \text{ g} / 18.0 \text{ g/mol})$ $6.02 \text{ kJ/mol} \times (100.0 \text{ g} / 18.0 \text{ g/mol})$ Often these problems are solved using the heat of vaporization (2259 J/g)

Bookmark File PDF Thermochemistry Problems And Solutions

or the heat of fusion (334.166 J/g).

ChemTeam: Thermochemistry Problems - One equation needed

[5] First, find the energy that the solution either absorbed or released. Then relate that amount of energy to the moles of NaOH $q_{\text{sol}} = (100.0 \text{ g water} + 6.50 \text{ g NaOH}) \times (37.8^\circ\text{C} - 21.6^\circ\text{C}) \times 4.18$
