Normal inspiration generates negative intrapleural pressure, which creates a pressure gradient between the atmosphere and the alveoli, resulting in air inflow. In mechanical ventilation, the pressure gradient results from increased (positive) pressure of the air source. Peak airway pressure is measured at the airway opening (P_{ao}) and is routinely displayed by mechanical ventilators.

Modern mechanical ventilators have modes previously unavailable when mechanical ventilation was first established as a support therapy more than 50 years ago. 1 Regardless of the manufacturer trade names assigned to these modes, all modes fall into 1 of 2 categories: volume control and pressure control. In volume-control mode, a flow of gas is delivered to achieve a set volume (ie, tidal volume [Vt]) with each ventilator breath.
